

Working with Inventory

Inventory in Quantify includes any equipment, part, product, etc. This includes both consumable and non-consumable items. There are two main repositories for inventory: the Product Catalog and the Consumables Catalog. Each store relevant information about the inventory you have entered (part number, description, dimensions, costs, etc.), except the amount you currently have on hand. To view current inventory levels, use the **Products** tab in the main Quantify interface and the **Consumables** node associated with a branch office.
