

# Quantify 2021

## FEATURES

- New artwork and icons for the 2021 release.
- Integration with Xero is now more secure using OAuth 2.0 sign-in and authentication.
- Requests on both web and desktop now include consumables, as well as enhanced filtering to limit the non-stocked parts at a location.
- To make it easier to re-use a Bill of Materials (BOM), you can now copy the BOM from any shipment in any status to a new shipment.
- Added error notification to the OK button on Options, so that errors can be viewed like other dialog boxes.

## ENHANCEMENTS

- Updated the look and feel of the installer to match other Avontus products.
- Installers are all now ISO 19770-2 software identification compliant. This helps larger organizations identify what software is installed.
- Expressions in pivots and reports have been improved to allow for more calculations.
- Rental invoices with a zero amount can now be synchronized with QuickBooks.
- Improved rendering of the request portal on the Microsoft Edge browser.
- The Cost column is now available on the transaction products pivot.
- You can now filter equipment on the request portal to only show materials for the parent location.
- Update certificate now used to digitally sign all of the binaries.
- Estimate pivot now performs better with thousands of estimates.
- UI Updates to PreReturn Dialog
- BOs updated to include TimeStamps on request from API users
- Additional List classes added on request from API users

## BUG FIXES

- Fixed inconsistencies regarding reorder, inspection, and warranty notifications.
- Fixed issue where scaffold tracking jobsites could be set as inactive when there are active stocked balances.
- Fixed issue where the description on the invoice additional charges pivot wasn't matching the description on the shipment.
- Fixed issue where Quantify was incorrectly locking a return even though it was created after the job was invoiced.
- Fixed issue where the Created Date on some of the invoices was displaying the current date and not the date and time the invoice was created.
- Fixed issue where, when copying an estimate to a reservation, the To and From combo boxes were locked.
- Invoice pivot now correctly identifies User1 (sales person) for scaffold tracking jobsites.
- Fixed bug on shipment when copying all available items into out of service.
- Fixed performance issue when swapping multiple re-rented materials with owned at the jobsite level.
- Improved performance viewing scaffolds on Google Earth for jobsites with thousands of scaffolds.
- Fixed issue with sorting dates on product forecast.
- Fixed issue with the quantity pivot where damaged and repairable materials were not matching the report.
- Fixed issue where purchase and work orders were not appearing on summary invoices in certain situations.
- Fixed issue where the custom catalog column (Custom1) was not visible when selling consumables.
- Fixed issue where the Comment field in the Products tab was not displaying on the products grid.
- Fixed issue where the Last Cost entry in the product catalog was incorrectly added when voiding a transaction.
- Fixed issue where an incorrect error message appeared when setting a product as inactive when there are out of service items.
- Fixed issue where multiple rental rates across the same serialized product was not consistent in some cases.
- Fixed issue with 'copy estimate to delivery' for bigger databases the large number of parts (products + consumables) at the branch.
